SUMMARY

The aerodynamic design of a wind-tunnel model of a wing representative of that of a subsonic jet transport aircraft, fitted with winglets, has been performed using two recently developed optimal wing-design computer programs. Both potential flow codes use a vortex lattice representation of the near-field of the aerodynamic surfaces for determination of the required mean camber surfaces for minimum induced drag, and both codes use far-field induced drag minimization procedures to obtain the required spanloads. One code uses a discrete vortex wake model for this far-field drag computation, while the second uses a 2-D advanced panel wake model. Wing camber shapes for the two codes are very similar, but the resulting winglet camber shapes differ widely. Design techniques and considerations for these two wind-tunnel models are detailed herein, including a description of the necessary modifications of the design geometry to format it for use by a numerically controlled (NC) machine for the actual model construction.

INTRODUCTION

The current emphasis on improving the fuel efficiency at cruise of existing transport aircraft, and designing future generations of aircraft with even further increases in fuel efficiency, has resulted in the consideration of several new, novel aircraft configurations. Examples are the so-called box plane studied in references 1 and 2, the joined wing concept of reference 3, and winglets as discussed in reference 4. Further model studies of improved transport performance may be found in references 5-7. These concepts generally use nonplanar lifting surfaces to reduce the induced drag.

Recently a vortex lattice wing-design computer program has been developed, described in reference 8, which computes for subcritical flow, using thin wing potential flow theory, the wing camber surfaces for one or two interacting planforms for minimum induced drag. The user specifies the configuration geometry in planview, dihedral angles, the reference wing area and span, the subsonic design Mach number and design lift coefficient. The desired

chordwise loading function must also be specified on each planform. The camber shape is computed directly which will achieve the desired lift, have zero pitching moment (for two planforms) and will have minimum induced drag. This program may be used as a preliminary design tool for constructing wind-tunnel models to investigate the above-mentioned new aircraft configurations, so long as the design is subcritical. Further, for configurations which are subcritical, this program is relatively inexpensive to run compared to more sophisticated transonic codes which use iterative techniques to achieve optimal solutions.

However, there is concern that the vortex lattice theory could lead to errors in design shape in the vicinity of a change in wing dihedral angle (refs. 9 and 10). This has lead to the development of an advanced panel far-field wake model (ref. 11) where the wing wakes are broken into flat panels, and where the wake vortex strength is assumed to vary linearly on each wake panel. This theory has been shown to be more accurate than a discrete vortex wake model (ref. 11). This wake model has been extended to obtain the bound circulation and spanload distributions for minimum induced drag for use in the vortex lattice wing-design code of reference 8. Extensions of this theory, as well as sample results from the modified design code, have been given in reference 12. Design results to date (refs. 12 and 13) have shown that the original code (ref. 8) and the modified code (ref. 12) give identical results except where there is a change in wing dihedral.

In an attempt to determine the capabilities of both of these subcritical design codes, two wind-tunnel models are currently being designed for a single transport type wing fitted with winglets. The design point is $M = 0.8$, $C_L = 0.5$, and it is expected that there will be only a very limited region of slightly supercritical flow. The wing planform for both models is the same as that used in one of the sample results given in reference 8. The winglet planforms for both models are identical; this planform has been chosen using the recommendations of reference 4. The two computer programs give essentially identical camber shapes on the wing, but yield widely different shapes on the winglet. Hence, a single wing model is to be built, using the results of the modified code, while both winglet models are to be constructed and tested for comparison. This report details the considerations used to design these two models. In particular, the data required for using a numerically controlled machine to cut the model surfaces is discussed.

SYMBOLS

| | |
|--------------|---|
| A | wing aspect ratio, defined as b^2/S |
| a | chordwise pressure loading parameter |
| b | wing span, cm (in.), equal to 71.491 cm (28.146 in.) |
| c | local chord, m (ft) |
| \bar{c} | mean chord, m (ft), equal to 0.2136 m (0.7008 ft) |
| C_p | pressure coefficient |
| ΔC_p | pressure difference coefficient |
| c_t | wing tip chord, cm (in.), equal to 8.113 cm (3.194 in.) |
| C_B | wing root bending moment coefficient |
| C_D | induced drag coefficient |
| C_L | lift coefficient |
| C_m | pitching moment coefficient about origin of body axis coordinate system shown in figure 1 |
| M | Mach number |
| q | dynamic pressure, Pa (lb/ft^2) |
| S | projected wing area, m^2 (ft^2), equal to 0.30595 m^2 (3.293 ft^2) |
| t | local semithickness, cm (in.) |
| X | streamwise body axis coordinate, cm (in.) |
| x | streamwise coordinate measured from local wing leading edge, cm (in.) |
| Y | spanwise coordinate, cm (in.) |
| Z | vertical coordinate, cm (in.) |
| z | coordinate normal to local wing chordplane, cm (in.) |
| α | angle of attack, radians (degrees) |
| ϵ | nondimensional chordwise coordinate |
| η | nondimensional spanwise coordinate |
| ϕ | dihedral angle, radians (degrees) |

MODEL WING-WINGLET DESCRIPTION

The current wind-tunnel wing-winglet models have been designed for use on an existing fuselage model, which has been used in a series of tests of previous wing-winglet models (ref. 5) and high-aspect ratio wing tests (ref. 7). The wing planform (fig. 1) was the same as that used in the single planform example of reference 8; however, the winglet plan view (fig. 2) has been altered to conform to recommended winglet-design criteria given in reference 4. The wing has been scaled so its projected span equals the span of the configurations tested in reference 5, using the same fuselage model. This wing planform is representative of current subsonic jet transport wings. Model wing projected area was 0.30595 m^2 (3.293 ft^2), and mean chord equaled 0.2136 m (0.7008 ft). The design point chosen was a Mach number of 0.8 and a lift coefficient of 0.5. These were chosen as being representative of current jet transports. Also it was felt desirable to attempt a model design at the highest values of Mach number and lift coefficient which seemed advisable. It is likely that for the model size chosen ($b = 1.430 \text{ m}$), the maximum Mach number achievable in the NASA-Langley 7×10 foot high-speed tunnel where the model is to be tested will be no greater than $M = 0.8$ (ref. 14). This design point was chosen such that once the wing thickness distribution was superimposed on the designed camber shape, the flow over the wing and winglet would be everywhere subcritical. Wing and winglet leading edge sweeps were 38.19 and 35.28 degrees, respectively. The wing had a trailing edge break at 0.388 times the total configuration projected semispan and a constant 6 degrees of dihedral. The winglet length was 0.143 times the projected span of the wing alone. The winglet trailing edge was straight, with a leading edge break at 0.25 times the winglet height. The lower 25 percent of the winglet was swept 61.6 degrees. The upper 75 percent of the winglet had a leading edge sweep of 35.28 degrees which, when projected down to the wing tip, intersected the tip at 0.65 times the wing tip chord. The winglet dihedral was 77.5 degrees (see fig. 2). These values, as well as the eight percent maximum thickness type NACA 64A008 thickness distribution (ref. 15), all followed the recommendations of reference 4. A design using a constant chordwise

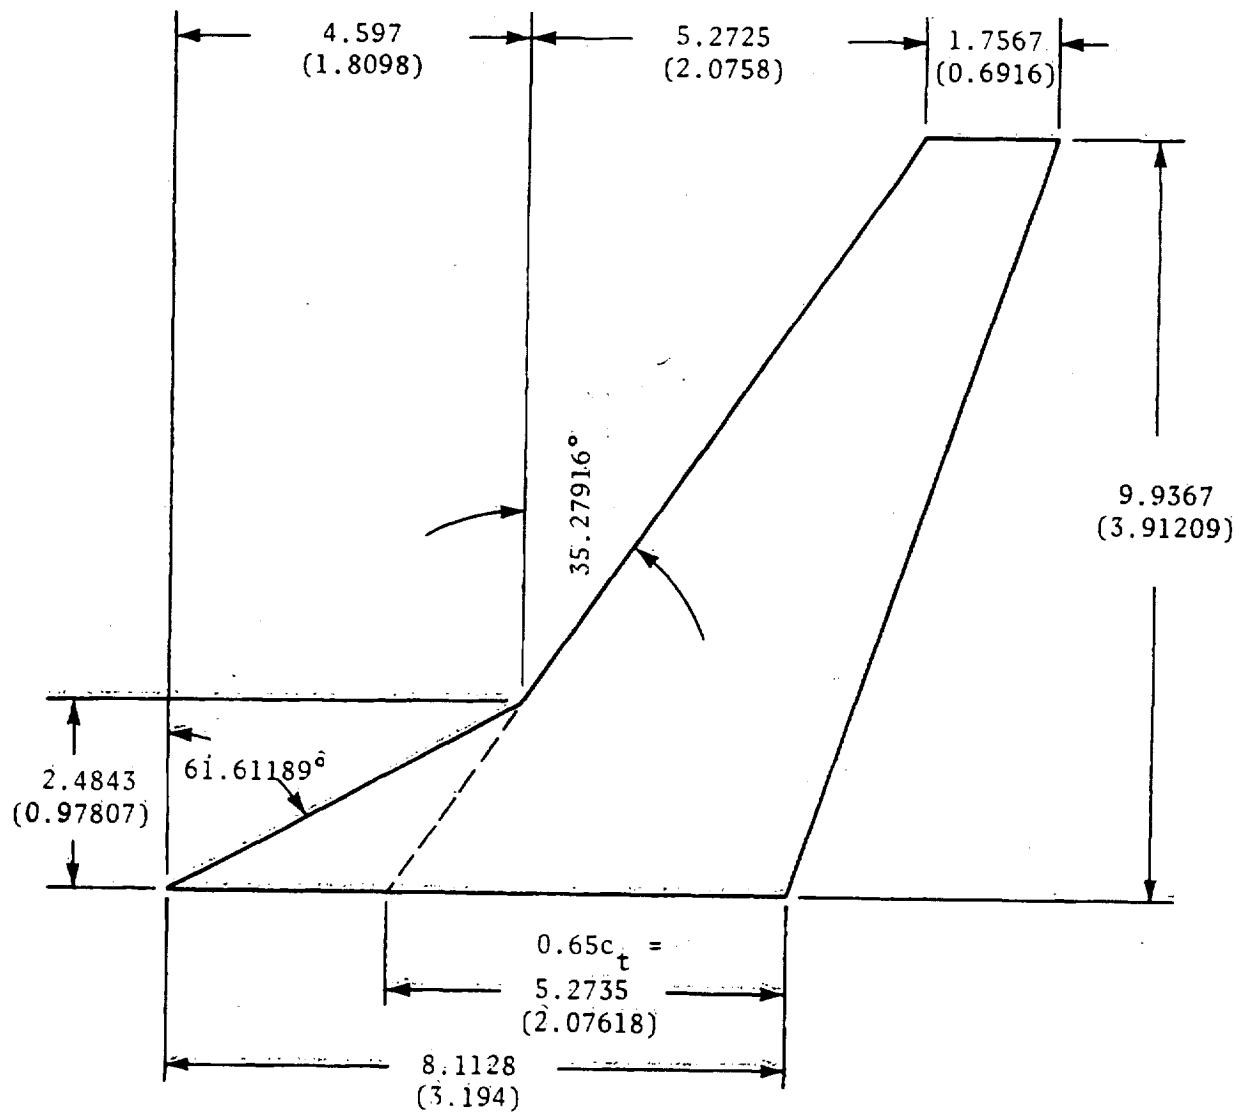

Figure 2. Winglet plan view. Dimensions are given in cm (in.).

loading function ($a = 1.0$) like that used in reference 8 has been chosen.

CAMBER SURFACE DESIGN

Once the model planform, scale, and design point had been chosen, the two inviscid design codes of references 8 and 12 were used to obtain the camber shapes predicted by each which would lead to minimum induced drag. In both codes, a vortex lattice near-field representation of 18 chordwise vortices by 21 spanwise was chosen. This was close to the maximum number of near-field singularities allowable in either code. The design camber shape was insensitive to these values over the limited range of 18×21 to 16×25 . The adopted lattice layout led to three camber lines on the winglet: one below the leading edge break and two above the break. The original design code was modified to use 96 discrete vortex unknowns, rather than the usual 100, in the Trefftz plane to determine the optimum span load. This was done to duplicate as nearly as possible the true wake shape for the wing-winglet model, given the restriction of equally spaced wake vortices (ref. 8). The modified code (ref. 12) used 50 wake panels having a cosine spacing. Thirty-five panels were used on the wing and 15 on the winglet. It is believed that the calculations for the modified code were more accurate, based upon results shown in references 11 and 12. The computed induced drag for the original code was 0.009034, while for the modified code using the advanced panel wake model $C_D = 0.008141$. This is inconsistent with results of reference 11, where the discrete vortex model was seen to underpredict the induced drag, but is believed to be due to inaccuracies in the discrete vortex wake shape. Further study as to the reason for these C_D values is required.

The necessary input data cards for both computer programs, as well as the resultant outputs are shown in Appendix A. The different optimum spanloads from these two programs are plotted in figure 3. They differ most significantly on the winglet and near the wing tip. Examples of the computed optimum camber shapes are shown in figure 4. Again, the differences in the two methods are confined to the region near the winglet on the wing and on the winglet itself. Similar results have been

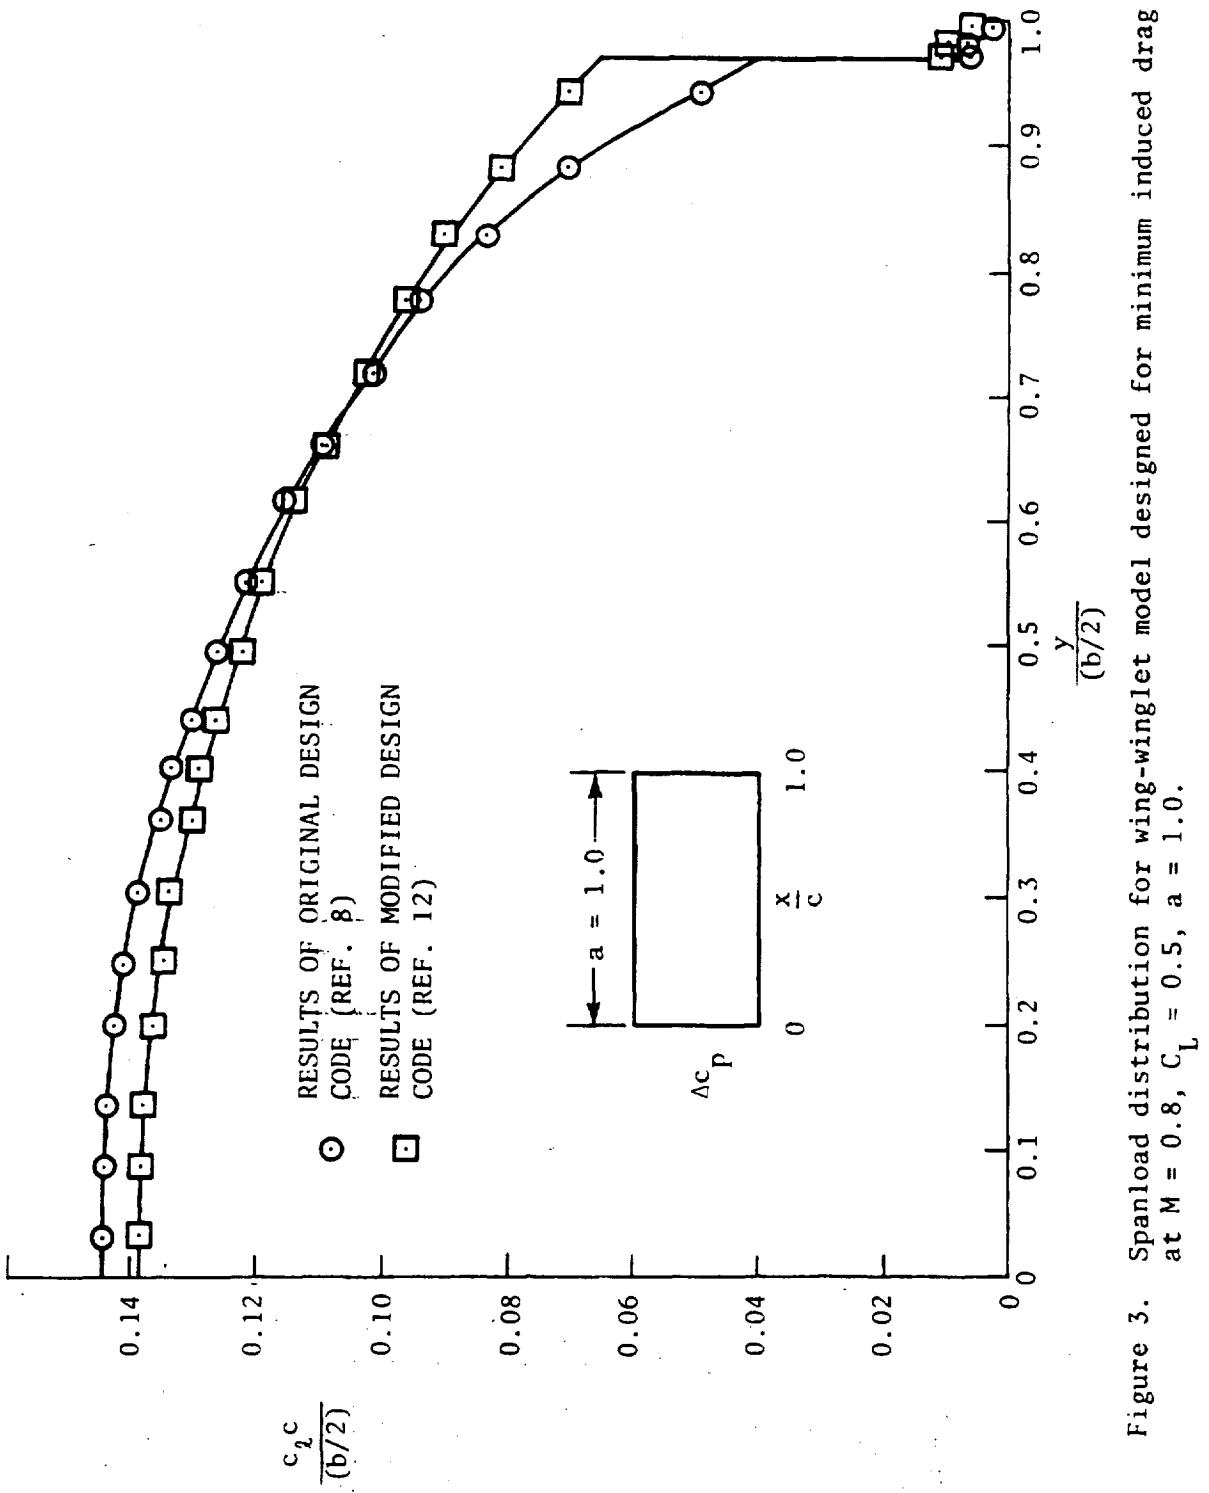

Figure 3. Spanload distribution for wing-winglet model designed for minimum induced drag
at $M = 0.8$, $C_L = 0.5$, $a = 1.0$.

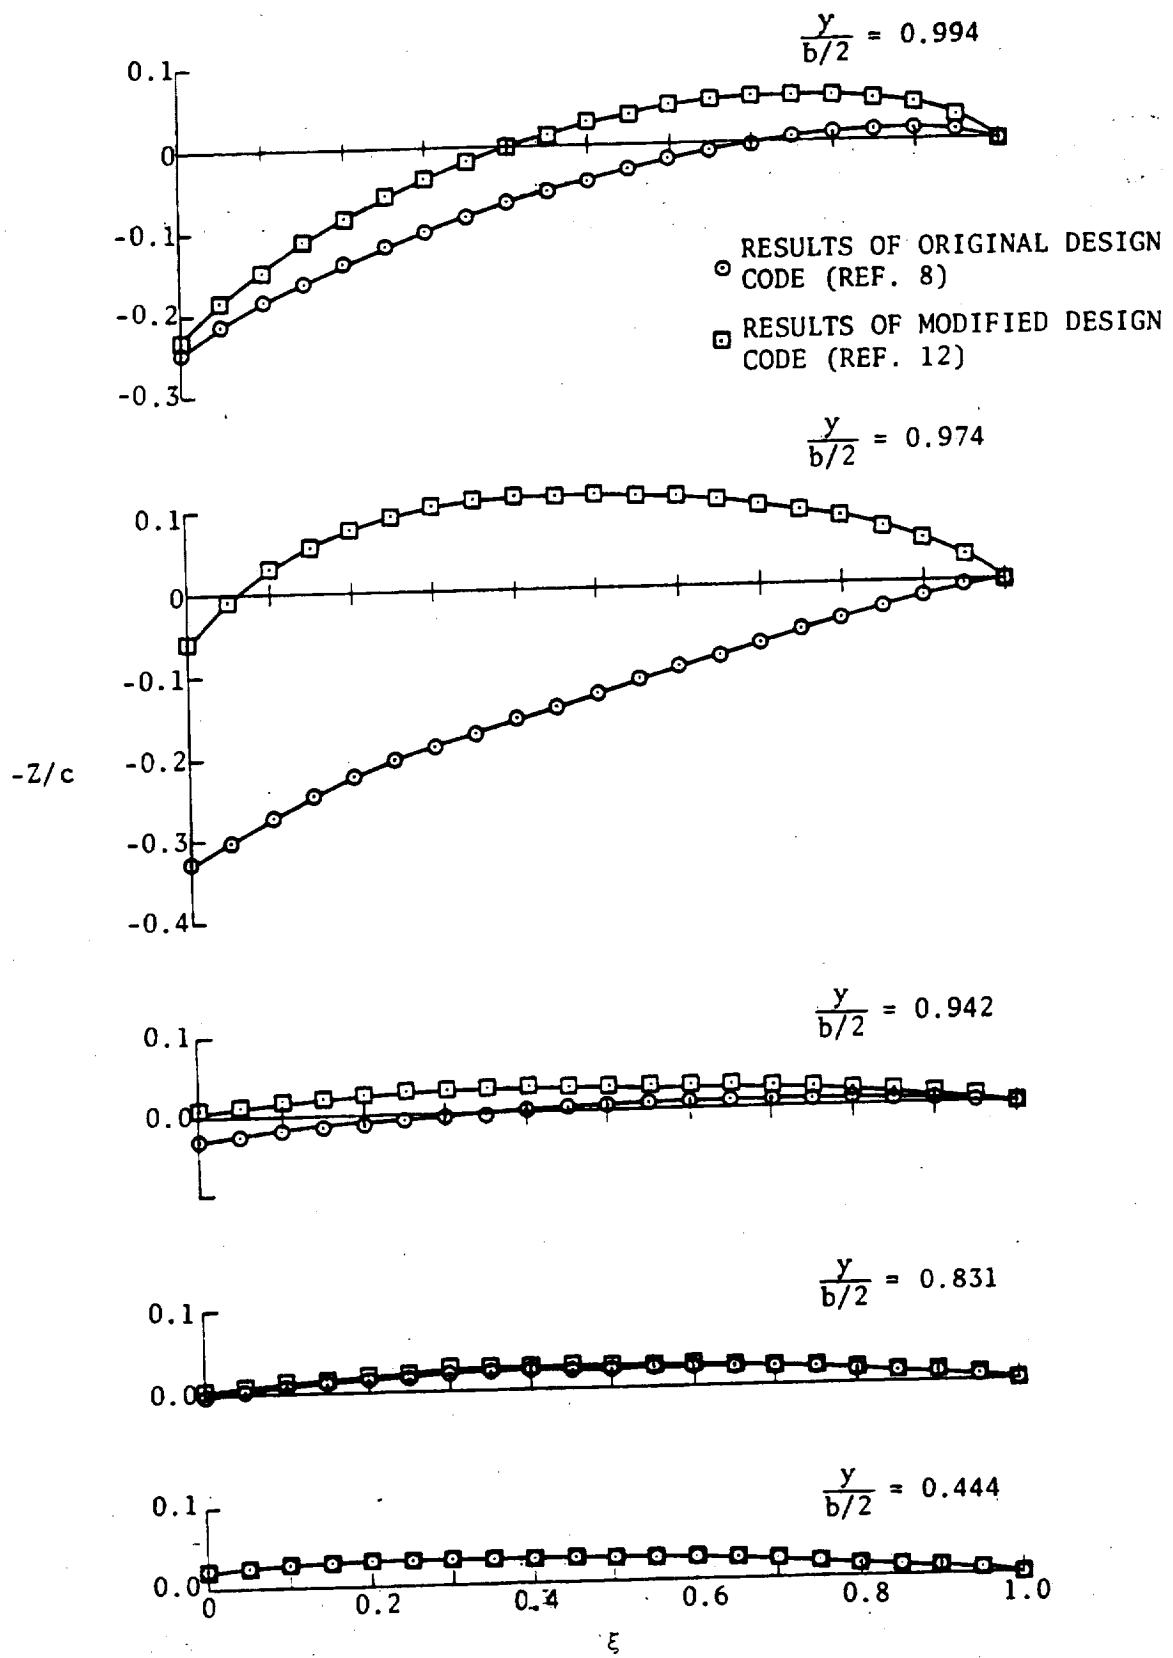

Figure 4. Camber shapes for wing-winglet model designed for minimum induced drag at $M = 0.8$, $C_L = 0.5$, $a = 1.0$.

presented previously in reference 12 for a similar wing-winglet configuration, having a different winglet planform.

Once these design results had been obtained, and the NACA 64A008 thickness distribution chosen, the three-dimensional potential flow code of reference 16 was utilized to check for any locally supercritical regions on the designed wing-winglet. All of the design camber surface Z/c values were rescaled by multiplying by the cosine of the local dihedral to obtain local airfoil cambers perpendicular to the plane of the wing or winglet. Also, the local n values had to be recomputed in terms of the fractional wing-winglet peripheral length. These input data were in a simplified namelist format developed under contract for NASA/Langley Research Center (LaRC) by the Computer Sciences Corporation. The resultant panel geometry for the modified code design is shown in figure 5, and sample chordwise pressure plots are shown in figure 6. There was a region of nearly constant ΔC_p , over about the middle 70 percent of the local chord, with the pressure difference falling to zero at the trailing edge, and with a slight rise at the leading edge. The minimum pressure coefficient computed on the configuration designed using the original code (ref. 8) was -0.5675, while the minimum found on the shape computed using the modified code (ref. 12) was -0.7461. These values occurred near the winglet root. The value of C_p for sonic conditions at $M = 0.8$ is -0.6910, so it is felt that there will not be any regions of supercritical flow on the model designed using the original code (ref. 8). The modified code model will have a small region of slightly supercritical flow near the root of the winglet. It is also noted that the chosen design point, $C_L = 0.5$ and $M = 0.8$, is as high as possible without appreciably violating the assumption of subcritical flow.

This summarizes the aerodynamic considerations undertaken for the design of the current models. The more complete design process, such as described in reference 17, was not undertaken, largely because these models must be tested to discover how useful the computer codes of references 8 and 12 are as design tools. The wing-winglet configuration chosen should provide a good test, while at the same time yielding information about which version of the design code is preferable. More sophisticated analysis programs modeling the flow over complete aircraft configurations,

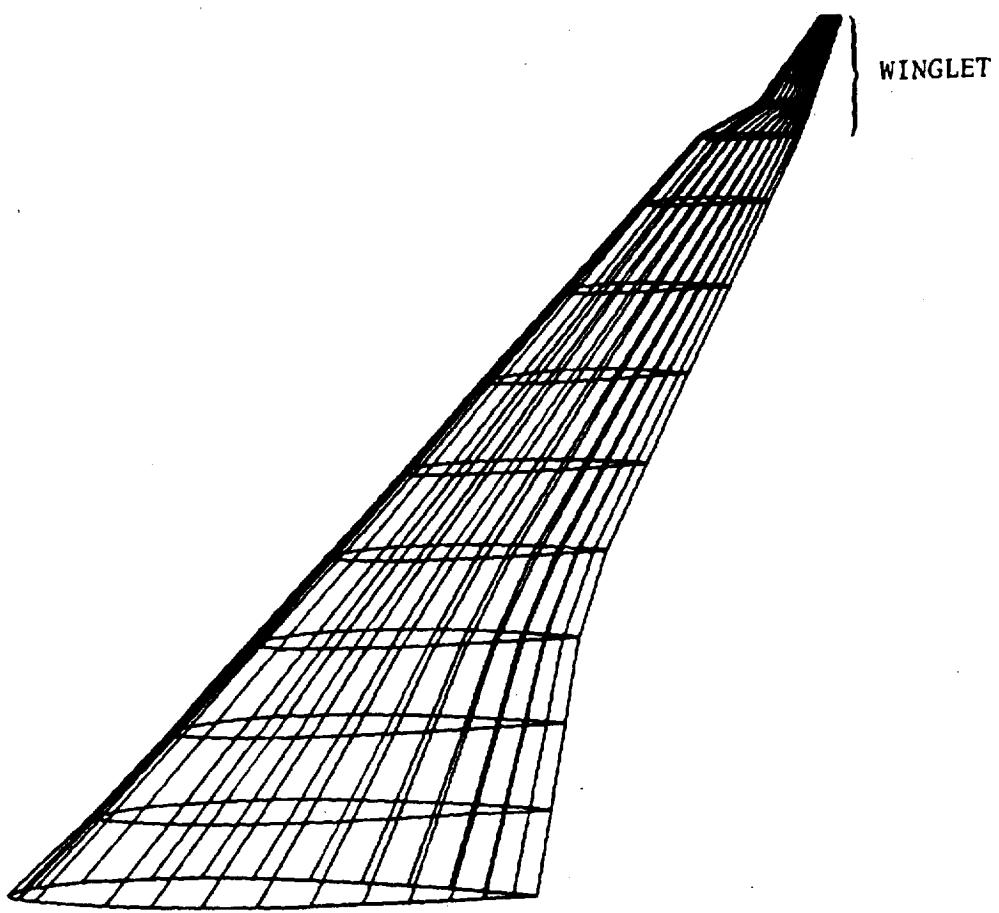

Figure 5. Perspective view of wing-winglet panel geometry for code of reference 16; design results of reference 12.

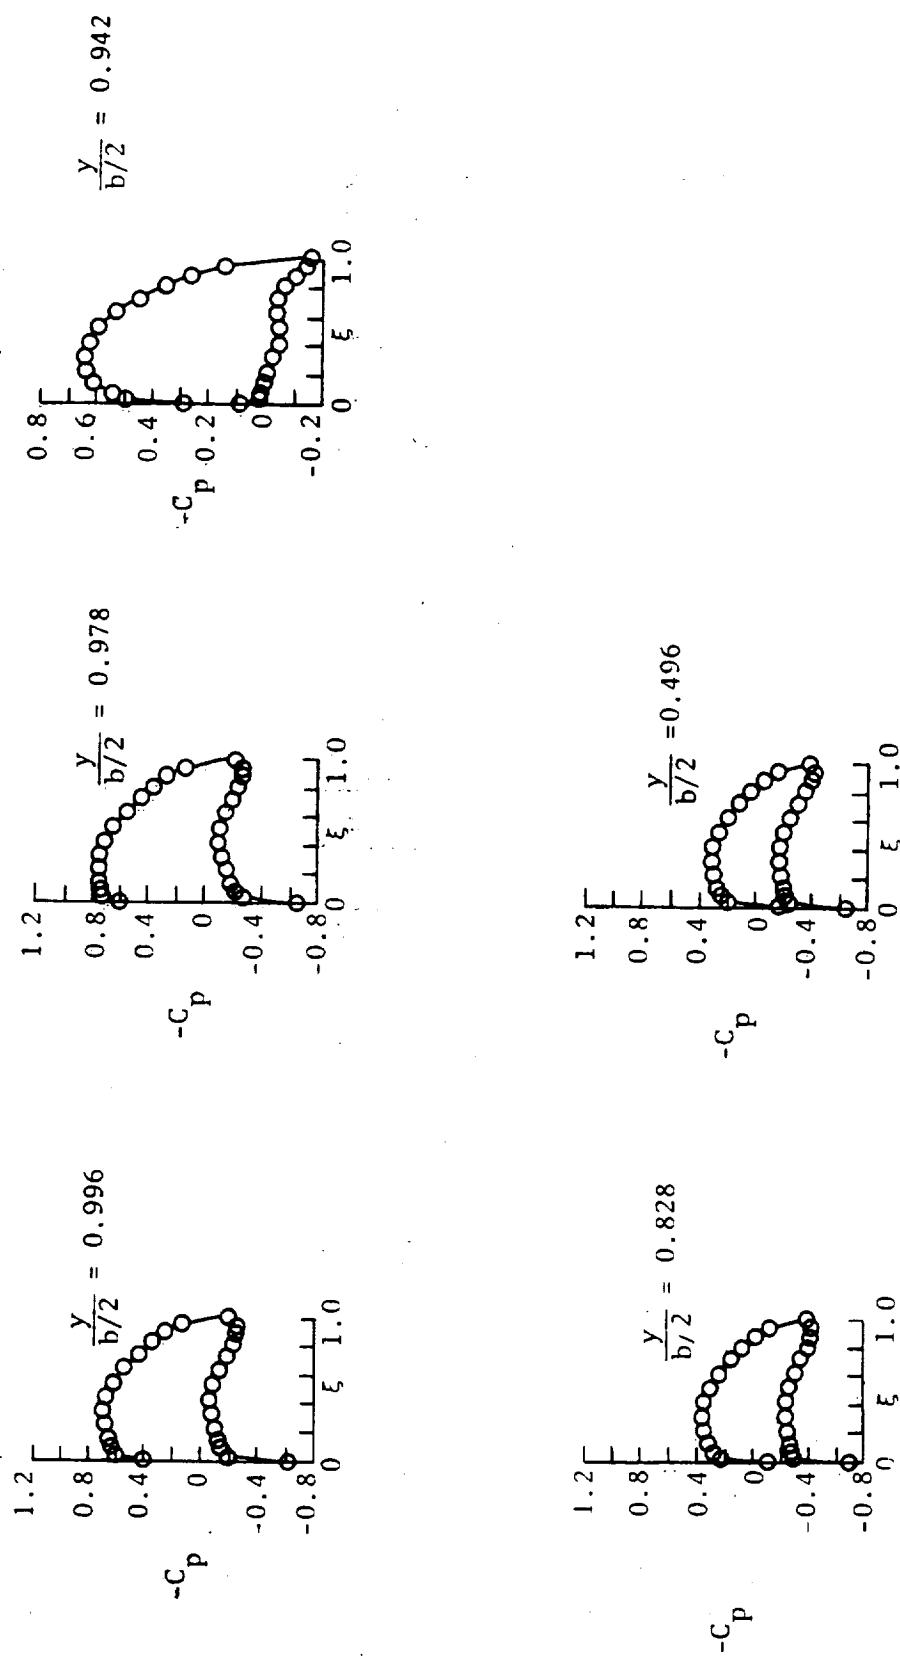

Figure 6. Hess code chordwise pressure coefficient distributions for wing-winglet designed by method of reference 12.

including the effects of bodies, thickness, shocks, and even viscous effects, as described in references 18 and 19 would be expected to yield more accurate performance predictions. The recent aerodynamic optimization programs of references 20 and 21 should allow determination of optimum configurations including the above nonideal effects.

DESIGN DETAILS

Several other basic model design specifications and criteria have been developed relating to the construction of the model itself. Since the wing cambers from both codes differed only in the region immediately adjacent to the wing-winglet junction, it was decided to build only one wing model, using the camber values from the modified design code (ref 12). The wing and winglet models will be cut using numerically controlled machining from steel, since the test dynamic pressures will be in the vicinity of $q = 34,100 \text{ Pa}$ ($720 \text{ lb}/\text{ft}^2$) at the design point (ref. 14). The wing and all winglet models will be cut separately so all surface coordinates will be measured perpendicular to the plane of the wing or the winglets. Four separate pairs of winglets will be constructed. These winglets will bolt to the model wing tip. Two pairs of winglets will be machined having the camber shape computed using the original design code (ref. 8). One of these winglet pairs will have static pressure ports at the 12.5 and 42.5 percent peripheral distance stations. Upper surface pressures will be sensed on one winglet; lower surface pressure taps will be placed at the same x/c values on the other winglet. The pressure tubing will join to larger tubing in the wing itself in a cutout cavity in the wing near the wing-winglet junction. The second winglet pair will have no pressure instrumentation, but will be fitted with full span 0.2 c trailing edge flaps which bolt to the winglet. The flat deflection angles will be 0° , $\pm 2^\circ$, $\pm 4^\circ$. The remaining two pairs of winglet models will be constructed having the camber shape of the modified design code (ref. 12); one pair will be fitted with pressure taps, while the second pair will be fitted with flaps, as described above. The wing model will have two chordwise rows of static pressure taps, at the 31 and 74 percent peripheral distance locations. All pressure tubing will be carried inside the fuselage to three scannivalves. The region of the junction between wing and winglets

will be formed by handwork using templates. The wing root region will be beveled to allow it to bolt to the fuselage strongback. Also, if feasible, the wing root region will be gaged to allow measurement of the wing root bending moment.

NUMERICALLY CONTROLLED MACHINE INPUT

Finally, a description is now given of the steps necessary to prepare an input deck to prepare a tape for use on the numerically controlled machine (type TX-23). A small computer program was written to rescale the camber shapes to be perpendicular to the local ϕ , by multiplying by $\cos \phi$. Then the t/c values were added to get upper and lower surface values, which were then multiplied by the local chord value in inches. This yielded a set of upper and lower surface coordinates, in inches, measured perpendicular to the wing or winglet planes. Next, these coordinates were extrapolated linearly to obtain coordinates at the wing root and tip, the location of the trailing edge break on the wing, the winglet root and tip, and the location of the leading edge break on the winglet. These values were then punched on cards in a 7F10.6 format. The airfoil shapes were also plotted using LaRC subroutine INFOPLT. The program listing and output are shown in Appendix B; along with the final decks to cut the wing and the winglet. Both decks shown were for the modified design code results (ref. 12). Also included are the N/C machine input deck preparation instructions. Examples of the wing and winglet airfoil sections are shown in figure 7.

The NASA/LaRC model shop personnel can supply sample data checks which aid in building an input deck for numerically controlled machining of a general wing. Categories I and II (see TX-23 Input, Appendix B) must be largely defined by the engineer, while items III, IV, and V are fairly standard and any needed changes in these cards can be made by the personnel in the model shop. Item II contains the bulk of the geometrical information, beginning with (X, Y) pairs, in inches, for the leading edge and trailing edge [Item (3), Link (1)]. These are followed by the Y values, in inches, at which the airfoil upper and lower surface coordinates are specified [Item (5), Link (1)]. The Items (8) and (9), Link (1), contain the percent chord locations, followed by the corresponding upper surface coordinates, in

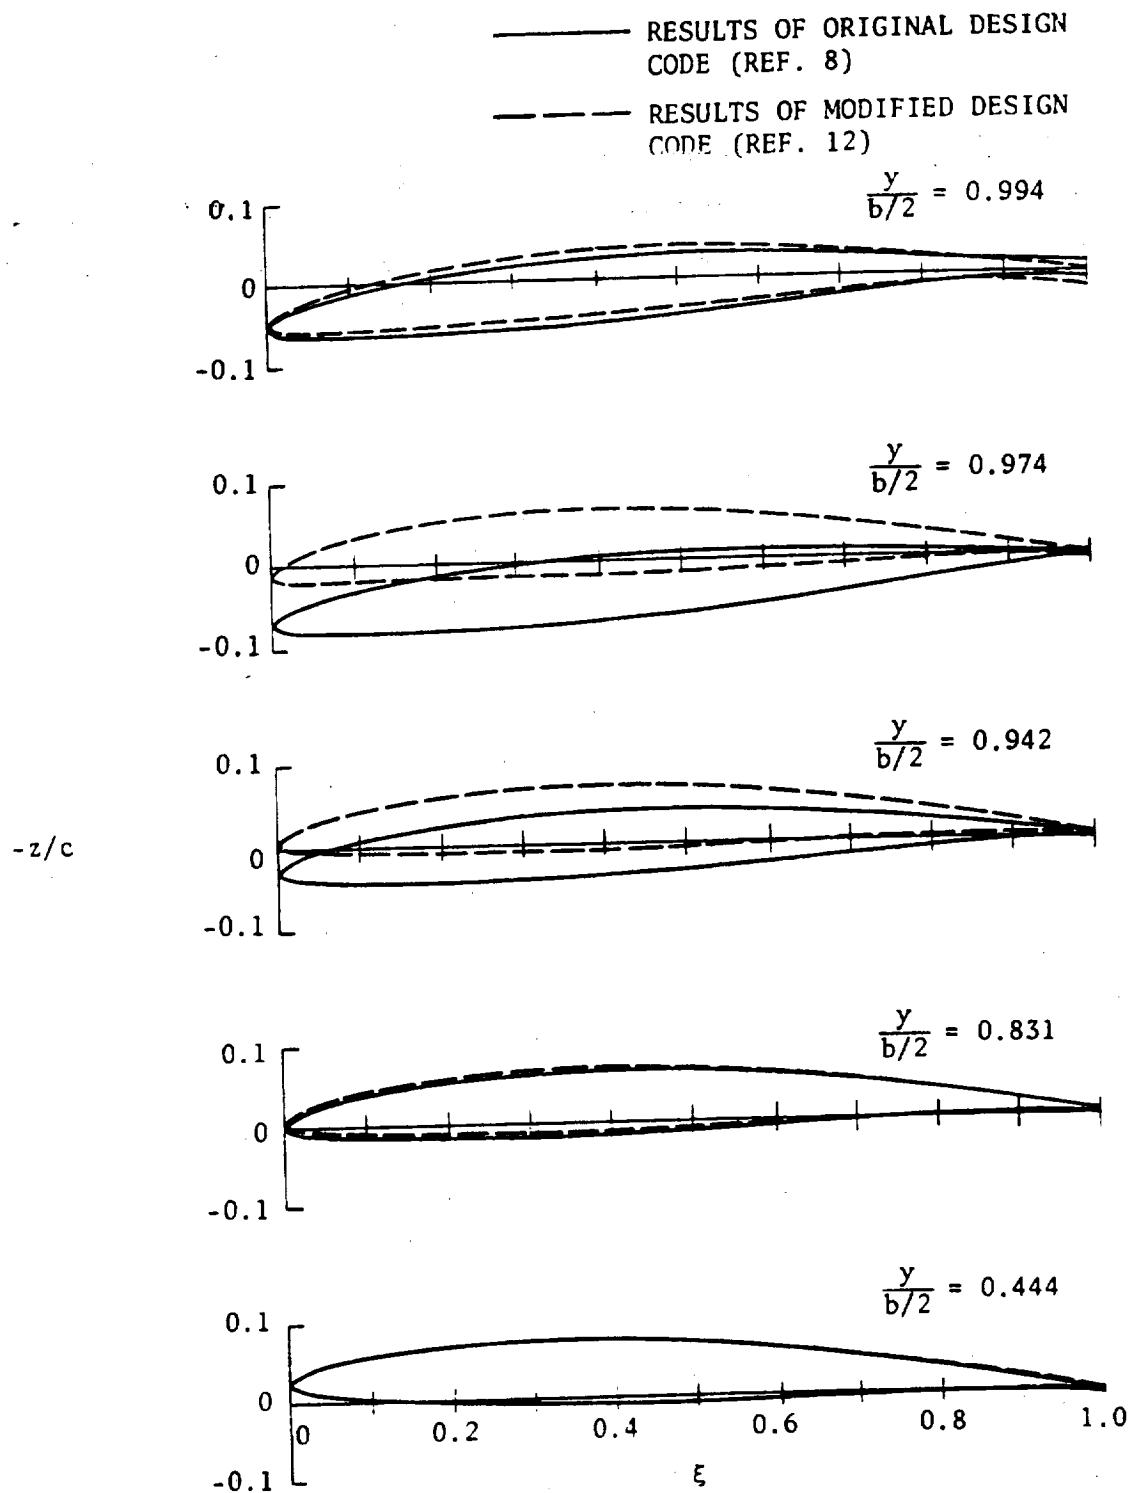

Figure 7. Comparison of wing-winglet model airfoil sections.

inches, and lower surface coordinates, in inches, at each airfoil station. A maximum of 21 airfoils may be specified, as has been done for the current wing model (Appendix B). A maximum of 30 coordinate triples may be specified for each airfoil. Straight line curve fitting in the spanwise direction and cubic curve fitting chordwise was used for the current models.

The detailed design work is currently being implemented under contract by LTV, and the final design will be constructed in-house by the model shop at NASA/LaRC.

CONCLUSIONS

The design process for construction of a wind-tunnel model of a subsonic transport wing fitted with winglets has been described. The camber shapes of the winglet models have been computed using two potential-flow wing-design programs. The two codes give quite different results on these winglets. As a result, these wind-tunnel models are to be used to determine which program gives a design shape with better performance. Also, the wind-tunnel test will provide information as to the utility of these potential flow programs in the design process. Also documented were the data preparation procedures necessary to obtain an input deck for numerically controlled machining of the models.

**DETAILS OF DATA PREPARATION FOR
NUMERICALLY CONTROLLED MACHINING
OF WING-WINGLET MODELS**

PRECEDING PAGE BLANK NOT FILMED

PROGRAM TX23Z(INPUT,OUTPUT,TAPE5,TAPE6=OUTPUT,TAPE10)

PROGRAM WRITTEN BY J KUHLMAN FOR PREPARING AIRFOIL COORDINATES, IN INCHES, FOR WING WITH WINGLET MODEL TO BE TESTED IN 7X10 FOOT TUNNEL. DESIGNED USING TN D-8090 DESIGN CODE BY LAMAR OR MODIFIED VERSION OF THIS CODE USING TREFFTZ PLANE WAKE MODEL OF CR-3154 BY KUHLMAN.

NAMELIST DATA INPUT INCLUDES CAMBERS (Z/C) FROM DESIGN CODES AT 21 SPAN STATIONS (PCTY HEREIN) AND 30 X/C STATIONS (PCTX HEREIN), AS WELL AS CHORD VALUES FOR WING, IN INCHES. THESE DATA SETS ARE STORED ON PERMANENT FILES ZOCJK AND ZCCOR.

TOC ARRAY IS SEMI-THICKNESS/C FOR NACA 64A008 BASIC THICKNESS FORM.

SINCH IS DISTANCE IN PLANE OF WING OR WINGLET MEASURED FROM ROOT.

LINEAR INTERPOLATION OR EXTRAPOLATION IN SPAN DIRECTION USING IUNI PERFORMED TO GENERATE ZS AT ROOT, TE BREAK, JCT OF WING AND WINGLET, LE BREAK ON WINGLET, AND WINGLET TIP.

THE Z/C TABLE IS SCALED BY THE LOCAL CHORD VALUE TIMES COSINE OF THE LOCAL DIHEDRAL ANGLE, SINCE WING AND WINGLET ARE TO BE MACHINED SEPARATELY.

THE YOB, CORD VALUES ARE THE INTERPOLATION STATIONS.

PCTX, YUP, YLO, ARE WRITTEN ON TAPE10 WHICH MAY THEN BE DISPOSED TO THE KEYPUNCH, TO OBTAIN PUNCHED INPUT CARDS FORMATTED FOR USE BY THE TX23 NUMERICAL CONTROL MACHINE.

INFOPLT PLOTS ZUP AND ZLO (UPPER AND LOWER SURFACE AIRFOIL COORDINATES) OVER CHORDS, VS PCTX.

I. Link (0) - (System Control)

Item (1) -- Alphanumeric Identification
(2) cards, (72 columns each)

Item (2) -- Next Link Number
(Col. 1-5, Right Justified)

II. Link (1) - (Planform and Airfoil Sections)

Item (1) -- (1) card, (Col. 1-10, Right-Justified)
KASE (= 0, New Case)
(≠ 0, Link 1 Def. on File 1)

Item (2) -- (1) card, (4 fields of 10 col. each)
Leading and Trailing Edge Data

(a) - (Col. 1-10, Right-Justified)
= 1 (Straight Line(s) on leading edge)
= 2 (Cubic curve on leading edge)

(b) - (Col. 11-20, Right-Justified)
(No. of points on leading edge)

(c) - (Col. 21-30, Right-Justified)
Same as (a) above for T.E.

(d) - (Col. 31-40, Right-Justified)
Same as (b) above for T.E.

Item (3) -- See form for L.E. and T.E. data

Item (4) -- (1) card, (9 data fields)
Airfoil Definition Data (21 Limit)

(a) - (Col. 1-5, Right-Justified)
= 1 (No airfoil fit)
= 2 (Fit straight lines)
= 3 (Fit cubics)

(b) - (Col. 6-10, R-J)
No. of given airfoils. (Max. 21)

(c) - (Col. 11-15, R-J)
No. of points per airfoil. (Max. 30)

- (d) - (Col. 16-20, R-J)
No. of camber line points
- (e) - (Col. 21-50, Left-Justified with decimal)
L.E. Radius
- (f) - (Col. 31-40, L-J w D)
T.E. Radius
- (g) - (Col. 41-50, L-J w D)
L.E. Thickness
- (h) - (Col. 51-60, L-J w D)
T.E. Thickness
- (i) - (Col. 61-70, L-J w D) (FAC = 1.0)

Item (5) - See form for airfoil WB lines.
YDEM for WB (lines)

Item (6) -- (1) card, (Max. of 20, one Col. fields)
A one in the (ith) column will apply a cubic fit to all
surface lines between the (ith) and (i + 1st) airfoils.
A zero will cause a straight line fit.

Item (7) -- (1) card, (Max. of 31, one Col. fields)
A one in the (ith) column will cause the (ith) airfoil
to be read from cards. A zero will make the (ith)
airfoil identical with the (i - 1st) airfoil.

Item (8) -- See form for airfoil ordinates percent-of-chord
locations.

Item (9) -- See form for airfoil ordinates. (order: percent, upper, lower)

CONTROL RETURNS TO LINK (0) FOR ITEM (2).

III. Link (3) - (Spanwise Percent Line Arrays)

Item (1) -- (1) card, (3 fields of 10 Col. each)

- (a) - (Col. 1-10, R-J)
(No. of percent line values in this set - Max. 31)
- (b) - (Col. 11-20, R-J)
= 1 (Read another set of line values)
= 0 (This is the last set of lines)

(c) - (Col. 21-30, R-J)
= 0 (In all cases)

Item (2) -- See form for percent line values.

CONTROL RETURNS TO LINK (0) FOR ITEM (2).

IV. Link (5) - (Cutter Motion and Surface Parameters)

Item (1) -- (1) card, (7 fields of 10 Col. each)

(a) - (Col. 1-10 R-J)
= 0 (Output both surfaces)
= 1 (Output upper surface only)
= 2 (Output lower surface only)

(b) - (Col. 11-20, R-J)
= 1 (MDI)

(c) - (Col. 21-30, R-J)
= 0 (Do not invert lower surf. Z)
= 1 (Do invert lower surf. Z)

(d) - (Col. 31-40, R-J)
= 0 (This is last case)
≠ 0 (Another case follows)

(e) - (Col. 41-50, R-J)
= 0 (Output cutter center)
= 1 (Output surf. points and normals)

(f) - (Col. 51-60, R-J)
= 0 (No plot output)
≠ 0 (Generate plot tape)

(g) - (Col. 61-70, R-J)
(Line print increment)

Item (2) -- (2) cards, (8 fields of 10 Col. each)

(a) - (Col. 1-10, L-J w decimal)
YS = (Outboard WBL for line cuts)

(b) - (Col. 11-20, L-J w dec.)
YE = (Inboard WBL for line cuts)

(c) - (Col. 21-30, L-J w dec.)
DY = (Point increment for line cuts)

(d) - (Col. 31-40, L-J w dec.)
PS = (First cut percent line)

(e) - (Col. 41-50, L-J w dec.)
PE = (Last cut percent line)

(f) - (Col. 51-60, L-J e dec.)
a = (Rotation angle, usually 0)

(g) - (Col. 61-70, L-J w dec.)
R = (Cutter radius)

(h) - (Col. 1-10. L-J w dec.)
PM = (1.0, Not used currently)

Item (3) -- (1) card, (1 field of 10 Col.)
(a) - (Col. 1-10, R-J)
NB = (No. of Butt Blocks.)

IF NB ≠ 0 Include ITEM (3.1)

Item (3.1) -- (1) card, (3 ≤ N ≤ 7 (10) Col. fields)

(a) - (Col. 1-10, L-J w dec.)
YB = (Y line at butt blocks)

(b) - (Cols. 11-20, 21-30,61-70)
 $X_{N,M}$ = (Butt block × locations)
(1 ≤ N ≤ 3; M = 1, 2)

CONTROL RETURNS TO LINK (0) FOR ITEM (2).

V. Link (6) - (Postprocessor Control Commands)

Items (1-N) -- (One statement per card.)

The input for Link (6) must be selected from the list that follows:

| <u>STATEMENT</u> | <u>FUNCTION</u> |
|--|---|
| (1) PARTNO - 66 Characters - | Part I.D. |
| (2) MACHIN/"Name", N, Mode | Postprocessor Selection |
| (3) CLEARP/XYPLAN, Z YZPLAN, X ZXPLAN, Y | Clearance Plane Clearance Plane Clearnace Plane |
| (4) TRANS /"X", "Y", "Z" | Coordinate Translation |
| (5) FROM /"X", "Y", "Z" | Set Point |
| (6) GO TO /"X", "Y", "Z" | Go to point |
| (7) GODLTA/"X", "Y", "Z" | End-of-line retract |
| (8) COOLNT/FLOOD MIST OFF | Coolant Control Coolant Control Coolant Control |
| (9) SPINDL/ON, CLW ON, CCLW OFF | Spindle Control Spindle Control Spindle Control |
| (10) TMARK /N N, AUTO | Manual Rewind Stop Auto Rewind Stop |
| (11) MCHTOL/e | Corner Tolerance |
| (12) INTOL/e | Surface Tolerance |
| (13) OUTTOL/e | Surface Tolerance |
| (14) REWIND/N | Automatic Rewind |
| (15) RETRCT | Move to CLEARP |
| (16) OPSTOP | Optional Stop Code |
| (17) STOP | Stop Code |
| (18) END | Process Points |
| (19) FINI | Program End |

CONTROL RETURNS TO LINK (0) FOR ITEM (2).

| 16. Abstract The aerodynamic design of a wind-tunnel model of a wing representative of that of a subsonic jet transport aircraft, fitted with winglets, has been performed using two recently developed optimal wing-design computer programs. Both potential flow codes use a vortex lattice representation of the near-field of the aerodynamic surfaces for determination of the required mean camber surfaces for minimum induced drag, and both codes use far-field induced drag minimization procedures to obtain the required spanloads. One code uses a discrete vortex wake model for this far-field drag computation, while the second uses a 2-D advanced panel wake model. Wing camber shapes for the two codes are very similar, but the resulting winglet camber shapes differ widely. Design techniques and considerations for these two wind-tunnel models are detailed herein, including a description of the necessary modifications of the design geometry to format it for use by a numerically controlled (NC) machine for the actual model construction. | | | |
